Computed tomography combines special x-ray equipment with sophisticated computers to produce multiple images or pictures of the inside of the body. These cross-sectional images can be processed on a workstation monitor, printed or transferred to a CD.

It might be necessary to give you some contrast media, which you have to drink before the examination. Sometimes we also inject contrast media into your vein. We use a safe ionic contrast media whose side effects are very low. During the injection you might get a warm feeling in your body, this is totally normal
